

Analysis of 500 lake catchments reveals the relationship between crop type, fertilizer and manure inputs and lake nutrient concentrations

Joe Stachelek, Cayelan C. Carey, Kelly M. Cobourn, Armen R. Kemanian, Tyler Wagner, Kathleen C. Weathers, Weizhe Weng and Patricia A. Soranno

Ecological Society of America, 2019 August

Introduction

Ag land-use is associated with higher lake nutrient concentrations (Soranno et al. 2017)

Introduction - Nutrient predictors

Nutrient inputs - Fertilizer and manure applications

Nutrient transport - Baseflow, soils, precipitation

Land-use cover - Specific crops, etc.

Buffer composition - Land-use cover, specific crops

Lake characteristics - Depth, area, etc.

Background - The macroscale

	Fine scale (1 watershed)	Macroscale (many watersheds)
Granular	Many studies	??
Aggregated	Few studies	Some studies

Background - Granular Ag data

Background - Granular Ag data

Lake Carlton – IL

Poorly Buffered

Argyle Lake – IL

Research Question(s)

1. Are more granular measures of Ag activity related to lake water quality (TN, TP) across hundreds of lakes and their watersheds?
2. Do relationships between watershed land use and lake water quality vary spatially among hydrologic and climatic regions?

Methods - 500 lake catchments

■ oligotrophic ■ mesotrophic ■ eutrophic ■ hypereutrophic

Methods - Regression Modelling

Model type: Hierarchical Bayesian

Predictands: TP, TN

Global predictors: 12 Granular Ag variables
3 Lake and watershed characteristics

Variable selection: None (*horseshoe* shrinkage)

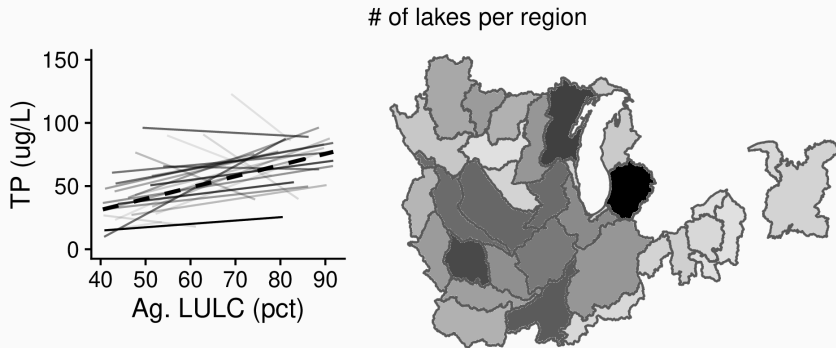

Regional predictors: 7 Watershed land-use variables

Model selection: Cross-validation on watershed land-use

Methods - Regression modelling

Watershed land use as a regionally varying predictor.

(Burcher, Valett, and Benfield 2007)

Results - Nutrient correlations

Results - Fixed effects

TP: Baseflow and Max depth have high leverage on predicted values.

TN: Buffer Ag land has a strong(er) leverage on predicted values.

Results - Regionally varying effects

TP: No evidence for regional variation in Ag slope

TN: Evidence for regional variation in corn slope

Results - TN Model

Ag sensitive regions have lower soil clay content and higher N deposition rates.

Conclusions

1. Are more granular measures of Ag activity related to lake water quality (TN, TP) across hundreds of lakes and their watersheds?

Yes, both lake TP and lake TN were related to granular measures of Ag activity.

But, specific crop land use and riparian buffer composition was more influential in the lake TN models.

2. Do relationships between Ag activities and lake water quality vary spatially among hydrologic and climatic regions?

Yes, in the case of lake TN concentrations.
